

FireMe - Demo Video Script (Scaler)

~7-8 minutes at a friendly pace | Kartikeya Krishna Mishra

Cue card for a nervous presenter. Each beat: time, mouse path, spoken lines (with fallbacks), code flash with exact line ranges, and why it matters for Scaler.

Before you record

- Wake <https://fireme-chi.vercel.app> until ColdStartNote says API is ready.
- Or check <https://fireme.onrender.com/api/health>.
- Primary meeting: Product roadmap sync. Optional: WIN 20260723 Pro.
- Stack: Next.js + FastAPI; SQLite locally, Postgres on live API.
- GitHub: <https://github.com/KartikeyaM2007/fireme>
- Keep editor open for code flashes. Speak slowly.

Code flash map (exact line ranges)

Label	File lines
Meeting models	backend/models.py lines 9-41
JWT require user	backend/auth.py lines 11-47
Seed roadmap sync	backend/seed.py lines 108-140
Meetings list API	backend/main.py lines 112-146
Generate insights	backend/main.py lines 406-427
POST ask endpoint	backend/main.py lines 446-459
Export entry	backend/exports.py lines 6-20
SQLite DATABASE_URL	backend/database.py lines 9-14
Seek / onTimeUpdate	Workspace.tsx lines 115-156
Transcript click-seek	Workspace.tsx lines 1777-1798
Toast stack	Workspace.tsx lines 2075-2104
Summary Generate	Workspace.tsx lines 1241-1255
Chapters + actions	Workspace.tsx lines 369-404
Pin / Share	Workspace.tsx lines 1145-1173
Settings DB note	Workspace.tsx lines 2007-2016
Live Coming soon	LiveHub.tsx lines 100-150
Speaker picker	LiveHub.tsx lines 437-456
Save live meeting	LiveHub.tsx lines 341-386
Hero workspace CTA	Landing.tsx lines 149-167
API ready note	ColdStartNote.tsx lines 47-64

Sections

0. Intro + stack | 0:00-0:40

What you click / show

1) Blank tab or FireMe logo. 2) Open live app URL. 3) Optional: show GitHub repo root with frontend/ and backend/ folders.

What you say

Hi - I'm Kartikeya. This is FireMe, a meeting intelligence workspace for Scaler. Capture or open a meeting, get a structured summary, a synced transcript, ask with citations, clip moments, and export. Stack: Next.js front,

FastAPI back. SQLite locally; live API uses Postgres with the same schema. About seven to eight minutes at a calm pace.

If it fails: Hosted on free tiers - I'm warming the API first so the demo stays smooth.

Code flash: backend/models.py lines 9-41

Point at: Meeting and TranscriptSegment - core timed meeting model. (5-8 sec)

Why it matters for Scaler

Shows a real domain model, not toy CRUD.

1. Landing CTA + auth | 0:40-1:20

What you click / show

1) Point at landing hero. 2) Signed out: Get Started / sign in. 3) Signed in: Open your workspace. 4) Land in workspace sidebar.

What you say

Landing is the product pitch. Real work starts in the workspace. Auth is Clerk JWTs on the API - every meeting request needs a verified user.

If it fails: Continue on signed-in session - same JWT check on the backend.

Code flash: Landing.tsx lines 149-167; then auth.py lines 11-47

Point at: Hero CTAs open workspace; current_user decodes Bearer JWT. (5-8 sec)

Why it matters for Scaler

Auth-gated product surface, not an open playground.

2. Cold start wait | 1:20-1:50

What you click / show

Watch cold-start banner: Waking the API -> API is ready. Wait before clicking meetings. If already ready, point once and move on.

What you say

API is on Render free tier. After idle it can take 30-60 seconds. ColdStartNote shows that honestly so reviewers don't think the app is broken.

If it fails: Refresh once; health check at fireme.onrender.com/api/health.

Code flash: ColdStartNote.tsx lines 47-64

Point at: Ready / warming copy that sets evaluator expectations. (5-8 sec)

Why it matters for Scaler

Production awareness - handle cold starts openly.

3. Library search + filters + open meeting | 1:50-2:40

What you click / show

1) Meetings list. 2) Search roadmap or analytics; clear. 3) Optional sort/filters. 4) Open Product roadmap sync. Mention WIN 20260723 Pro optional.

What you say

Starter meetings come from seed data - no upload required. Product roadmap sync is the main story. List API supports search and filters on the server.

If it fails: Seed runs on first meetings fetch - refresh once.

Code flash: seed.py lines 108-140; main.py lines 112-146

Point at: provision_starter_meetings; GET /api/meetings with query filters. (5-8 sec)

Why it matters for Scaler

Demo data + real list/search API without setup friction.

4. Pin / Share (brief) | 2:40-3:00

What you click / show

Pin Product roadmap sync (toast). Share / copy meeting link (toast). Do not linger.

What you say

Pin keeps the demo meeting on top. Share copies a deep link with the meeting id. Small UX details that help in a review.

If it fails: Clipboard blocked - same URL with meeting query param.

Code flash: Workspace.tsx lines 1145-1173

Point at: togglePin and shareMeeting with toasts. (5-8 sec)

Why it matters for Scaler

Thoughtful workspace UX beyond a bare feature list.

5. Summary + Generate + actions + chapters | 3:00-3:50

What you click / show

Summary tab: skim summary/topics/chapters. Click Generate if useful. Toggle one action checkbox. Click a chapter to jump.

What you say

Summary is the first value prop - skim without rewatching. Generate fills summary, topics, chapters, and actions. Toggle an action, then click a chapter to jump into that moment.

If it fails: Seeded summary is already here - same insights pipeline when warm.

Code flash: Workspace.tsx lines 1241-1255 and 369-404; main.py lines 406-427

Point at: generate() POST; chapters onSeek + action checkbox; backend writes fields. (5-8 sec)

Why it matters for Scaler

End-to-end AI insights wired UI to API to model fields.

6. Transcript search + click-to-seek (CORE) | 3:50-5:20

What you click / show

1) Transcript tab. 2) Search analytics. 3) Click a timestamp. 4) Player seeks; active line highlights. 5) Scrub seek bar - highlight follows. 6) Optional second click. LONGEST BEAT - slow down.

What you say

This is the core of FireMe. Every line has a start time. Click the timestamp - player jumps. Scrub the player - active line follows. Audio and text are one pipeline. Search finds a moment; click-to-seek takes you there.

If it fails: No media: seek bar and active line still sync on timestamps. Click noop: setSeek drives player and playing class.

Code flash: Workspace.tsx lines 115-156; then lines 1777-1798 (optional toast 2075-2104)

Point at: setSeek / onTimeUpdate; segment onClick setSeek(start_seconds). (5-8 sec)

Why it matters for Scaler

Core product proof - time-aligned transcript UX.

7. Ask FireMe | 5:20-6:00

What you click / show

Ask FireMe tab. Type exactly: What did we decide about analytics? Submit. Show answer and history/citations if present.

What you say

Ask is grounded in this meeting's transcript - not generic chat. Sample: What did we decide about analytics? Analytics anchors the release. Answers are stored on the meeting.

If it fails: First LLM call after wake can be slow - endpoint is POST ask.

Code flash: backend/main.py lines 446-459

Point at: ask -> answer_question -> persist MeetingQuestion. (5-8 sec)

Why it matters for Scaler

Meeting-scoped Q&A with persistence.

8. Clips / soundbite | 6:00-6:30

What you click / show

Clips & notes tab. Play seeded soundbite/highlight if present. Or create from Transcript line actions.

What you say

Clips and soundbites turn a moment into something you can replay. Seeded demo extras include a soundbite so you need not create one live.

If it fails: Skip creating live - note kinds are comment, highlight, soundbite.

Code flash: Workspace.tsx lines 1884-1918

Point at: Soundbite sets clipPlay start/end for ranged playback. (5-8 sec)

Why it matters for Scaler

Moments become reusable artifacts.

9. Export | 6:30-6:55

What you click / show

Open Export meeting. Show Markdown / TXT / PDF. Download one format.

What you say

Export packages summary, actions, and transcript for handoff. Same content path powers markdown, text, and PDF.

If it fails: Browser blocked download - API is GET export with format query.

Code flash: backend/exports.py lines 6-20 (route main.py ~474-498)

Point at: export_text builds summary + actions + timed transcript. (5-8 sec)

Why it matters for Scaler

Deliverable output - meetings leave as documents.

10. Live Hub | 6:55-7:40

What you click / show

Live hub: point Coming soon on Zoom/Meet/Teams. Start live capture. Switch Speaker 1/2/3. Optional short line. Save as meeting or explain and Back.

What you say

Live Hub is for in-progress conversations. Platform bots are Coming soon. Browser capture works today. Label Speaker 1/2/3, then save into the same workspace.

If it fails: Mic denied - save path posts meeting plus timestamped segments.

Code flash: LiveHub.tsx lines 100-150; 437-456; 341-386

Point at: Coming soon pills; speaker buttons; save creates meeting + segments. (5-8 sec)

Why it matters for Scaler

Capture into same post-meeting workspace; clear shipped vs soon.

11. Settings DB note + logo home | 7:40-7:55

What you click / show

Open Settings - read SQLite locally / Postgres live / Render note. Close. Click FireMe logo / brand home to landing.

What you say

Settings calls out the database story and Coming soon integrations. Logo takes you home - clean exit to the marketing surface.

Code flash: Workspace.tsx lines 2007-2016; database.py lines 9-14

Point at: Settings DB copy; DATABASE_URL default sqlite:///./fireme.db. (5-8 sec)

Why it matters for Scaler

Local/prod parity explained.

12. Closing - GitHub folders | 7:55-8:15

What you click / show

Open github.com/KartikeyaM2007/fireme. Point at frontend/ and backend/. End on that frame or landing hero.

What you say

That's FireMe - landing and auth, cold-start honesty, seeded library, summary and actions, synced transcript, Ask, clips, export, and live capture. Code splits cleanly into frontend and backend. Thanks for watching.

Code flash: GitHub repo root - frontend/ and backend/

Point at: Folder split for reviewers. (5-8 sec)

Why it matters for Scaler

Clear project structure for evaluation.

Cheat sheet

Time	On screen	Code flash (lines)	Say
0:00	Logo / open app	models.py 9-41	Intro + stack
0:40	Landing -> workspace	Landing 149-167; auth 11-47	CTA + JWT
1:20	Cold start banner	ColdStartNote 47-64	API ready
1:50	Library + open meeting	seed 108-140; main 112-146	Roadmap sync
2:40	Pin + Share	Workspace 1145-1173	Pin toast; link
3:00	Summary / actions	Workspace 1241-1255, 369-404	Generate + jump
3:50	Transcript seek CORE	Workspace 115-156, 1777-1798	Click timestamp
5:20	Ask FireMe	main.py 446-459	Analytics Q
6:00	Clips / soundbite	Workspace 1884-1918	Replay moment
6:30	Export	exports.py 6-20	MD/TXT/PDF
6:55	Live Hub	LiveHub 100-150, 437-456, 341-386	Speakers + save
7:40	Settings + home	Workspace 2007-2016; database 9-14	DB note
7:55	GitHub folders	frontend/ + backend/	Close + thanks

Recording tips

- Wake the app before you hit record. Friendly pace = ~7-8 minutes total.
- Primary meeting: Product roadmap sync. Optional video: WIN 20260723 Pro.
- Longest beat = transcript <-> player sync. Do it twice if needed.
- Ask sample question exactly: What did we decide about analytics?

- Code flashes: jump to line range, highlight ~15-40 lines, one sentence, back to UI in 5-8 sec.
- If anything fails, use the fallback line - never freeze silently.
- Full-screen browser, zoom ~110%, hide bookmarks bar.
