

FireMe - Demo Video Script (Scaler)

~5-6 minutes | Kartikeya Krishna Mishra

Before you record

- Wake <https://fireme-chi.vercel.app> until the API is ready.
- Or check <https://fireme.onrender.com/api/health>.
- Primary meeting: Product roadmap sync.
- Optional real video: WIN 20260723 Pro.
- GitHub: <https://github.com/KartikeyaM2007/fireme>

Sections

0. Intro

Code: backend/app/models.py

Show: Logo / blank tab, then open the live app URL.

Say: Hi - I'm Kartikeya. FireMe is a meeting intelligence workspace: record or upload a meeting, get a structured summary, a synced transcript, ask questions with citations, and export clips. Built for Scaler - about five minutes end to end.

1. Landing + workspace

Code: frontend Landing.tsx, backend auth.py, ColdStartNote.tsx

Show: Landing page hero and CTA. Sign in / enter workspace. If cold start banner appears, wait for API health then continue.

Say: Landing is the product pitch. Auth gates the workspace. Hosted API may cold-start - ColdStartNote surfaces that so demo time isn't wasted.

2. Meetings library

Code: backend seed.py (demo meetings)

Show: Meetings list - open Primary meeting: Product roadmap sync. Optionally note WIN 20260723 Pro.

Say: Seeded demo meetings so reviewers don't need a fresh upload. I'll use Product roadmap sync as the primary walkthrough.

3. Summary tab

Code: frontend Workspace.tsx (Summary)

Show: Open the meeting -> Summary tab: decisions, action items, overview.

Say: Summary is the first value prop - structured notes you can skim without rewatching.

4. Transcript + player sync (CORE)

Code: frontend Workspace.tsx - seek / timestamp click

Show: Transcript tab. Click a timestamp; player jumps. Scrub player; highlight follows.

Say: This is the core demo beat: transcript and player stay in sync. Click any line to seek - proof the pipeline ties audio to text.

5. Ask FireMe

Code: backend main.py - POST /ask (or ask endpoint)

Show: Ask FireMe panel. Type: What did we decide about analytics? Submit; show answer + citations.

Say: Ask FireMe answers from this meeting's context - not generic chat. Sample: What did we

decide about analytics? Watch citations point back into the transcript.

6. Clips & export

Code: backend exports.py

Show: Select a range or clip -> export (download / share path as implemented).

Say: Exports turn moments into shareable artifacts - clips and packages via the export pipeline.

7. Live capture

Code: frontend LiveHub.tsx

Show: Live Hub: start/manual capture UI. Label Speaker 1 / 2 / 3 manually. Point at Coming soon for meeting bots.

Say: Live capture is for in-progress meetings. Speakers can be tagged manually today; bot joins are marked Coming soon.

8. Logo home + close

Code: -

Show: Click logo / home -> landing. End on GitHub link if useful.

Say: That's FireMe - summary, synced transcript, Ask, clips, and live. **Code:** github.com/KartikeyaM2007/fireme. Thanks.

Cheat sheet

Time	UI	Code	Say
0:00	Logo / open app	models.py	Intro + what FireMe is
0:30	Landing -> workspace	Landing, auth, ColdStart	Auth + cold-start note
1:10	Meetings library	seed.py	Open Product roadmap sync
1:40	Summary tab	Workspace.tsx	Decisions & action items
2:20	Transcript + seek	Workspace seek	CORE: click timestamp
3:20	Ask FireMe	POST ask	Analytics decision Q
4:10	Clips & export	exports.py	Export a moment
4:50	Live Hub	LiveHub.tsx	Speakers; bots soon
5:30	Logo / close	-	GitHub + thanks

Recording tips

- Wake <https://fireme-chi.vercel.app> (or health-check Render) before record - wait until API ready.
- Primary meeting: Product roadmap sync. Optional real video: WIN 20260723 Pro.
- Spend the most time on transcript <-> player sync; that is the CORE beat.
- Ask sample question exactly: What did we decide about analytics?
- Keep UI readable: full-screen browser, zoom ~110%, hide bookmarks bar.
